

## What is OneCMS?

The hub of the OneCMS ecosystem is the OneCMS Tool. We have customized a third-party system—Alfresco—to meet HMH’s specific needs.

HMH is using it for:

- program planning
- workflow management
- asset storage and management
- structuring programs consistently, facilitating more reuse and flexibility
- metadata management, including delivering required outputs to the Metadata Store (MDS) for Ed
- standards management
- learning spine management
- publishing to various outputs

## Ecosystem vs Tool

The OneCMS Ecosystem refers to the collective group of tools and applications used in HMH’s content production workflow. The OneCMS tool is the management system that takes the disparate inputs from all of these applications and combines them for delivery onto a user facing platform.

In most cases, if instructions state “in OneCMS” they are referring to the tool. The ecosystem will always be referenced with its full name.
